## Ipad apps free without jailbreak

The iPad was recently jailbroken. Even if you've kept out jailbreaking other iPhone OS devices, iPad hardware substantially faster and difficult to define 3rd role device makes the best case yet for jailbreaking. An updated user and developer compatibility list will help you see what's safe to install on your iPad, and I'll list my favorite apps and extensions for your freshly jailbroken device. The Apple App Store has become notorious for its restrictive and often arbitrary decisions about what it does and does not do in store. I've seen many quality software pieces get turned down or kicked out of the App Store, sometimes for unclear or unknown reasons. Many of these, however, have subsequently made their way into Cydia, jailbroken app installer (note that the App Store works very well on jailbroken devices as well). GV Mobile, an excellent interface for Google Voice, Dashboard, a clone of the mac OS X dashboard for iPad, and Wifi Sync, a paid app for performing iTunes synchronization over Wi-Fi, are just a few examples. And there are a lot of programs and extensions that are available in Cydia that have never even been featured at the App Store. Aside from these examples of nixed software, the world of jailbreaking also offers a multitude of tricks that are not available to the user on a normal iDevice, such as changing system sounds or interface elements. While a much higher proportion of software available through Cydia is free compared to what you will find on the App Store, it also does not contain paid software. Single-button installation screen for The Spirit jailbreak for iPad. Many people express concern about jailbreaking their iPhones because they do not want to sacrifice stability or speed on their phones. While the vast majority of jailbreak software is perfectly stable, it is true that this software does not go through the same level of grueling testing to that Apple software subjects that makes it into the App Store. And software that allows you to run third-party programs in the background, otherwise change the interface, and so on, can have effects on your device's performance, so I can understand why some people are reticent about this. However, the iPad processor and memory are substantially more powerful than that of current iPhones and iPod Touches. Its hardware makes it much more suitable for effective multitasking, and its role in the workflow of most peoples makes it a good for jailbreaking, both because jailbreaking makes it more useful, and because it simply won't be used just like the phone. If jailbreaking means accepting a slightly lower standard of stability (which is debatable to begin with), it simply isn't as like on your phone. After all, the iPad is a begging device to be treated more like a computer than a phone, and jailbreaking makes as much possible than Apple's approved software, possibly can. I for one am willing to sacrifice a little polish for the functionality on the iPad. It's worth however, that multitasking will come to the iPad with Apple's blessing, albeit in limited form, with this fall's release of iPhone OS 4. Now, due to the nature of the software available through Cydia, it is important to remember that not everything originally written for iPhone/iPod Touch works with iPad. Be sure to consult the Google Docs spreadsheet created by the iPhone Dev Team Member MuscleNerd, before installing anything through Cydia. If you stick to this list, you should be safe. And if you like to live dangerously, remember that you can always restore and be back to where you started, if necessary (and don't forget to make a note in Google Doc about what happened!). We created a wiki page to track compatible apps as well. My favorite jailbreak programs right now (on both iPhone and iPad) are Notifier, a little extension that puts icons in the status bar for new email, messages, etc., SBSettings, a small panel of useful controls that slide down from the status bar, even within other apps, and Backgrounder (source code), so you can listen to Pandora while projecting an email (for example). Another one of particular interest to iPad users is called FullForce, and it's a convenient, implementing package of an elaborate.plist hack (via Gizmodo), which allows iPhone apps format themselves for the iPad screen without doubling the pixel. It's not perfect, but it works spectacularly for many apps, including Facebook and the New York Times. These programs don't all have their own sites, but you can find them in Cydia on your jailbroken iDevice, along with your description and screenshots. For those of you planning to jailbreak, once you do, don't forget to back up SHSH blobs, iTunes hashes controls when you restore, so you can restore to this jailbreakable version of the operating system, even after Apple updates, close the jailbreak vulnerability, and stop signing the restores of OS 3.2. This way, if you ever need/want to restore to an earlier version of the operating system, it's simple to trick iTunes with backed up blobs. Saurik, renowned in the jailbreak community for creating Cydia, has a good explanation along with detailed instructions on doing so on his website. Once you're locked up, it's easier to support them through Cydia. Alternatively, this method, using a program called Firmware Umbrella, works whether or not you are jailbroken, and it's a good idea if you haven't yet, but I think you might want to in the future. Finally, do not take into account that jailbreaking cancels the warranty regarding Apple is concerned, so always restore to a non-jailbroken state before taking your device to Apple for service. If you've turned off your iPad or iPad mini, there are plenty of apps Available tricks that not only can make using your iPad much more enjoyable, but improve iOS core features and make them much better. It's not unusual for Apple to implement jailbreak ideas and concepts in future versions of iOS, but why wait when you can them now? There are a lot of jailbreak tricks and apps available in Cydia and shoving through them all can be a task. We've already told you our favorite jailbreak apps for iPhone and these are our favorites for iPad and iPad mini. NCSettings Accessing settings every time you want to turn WiFi on or off or change the brightness of your iPad can be irritating. NCSettings adds quick switches to the Notification Center to quickly access settings such as brightness, WiFi, cellular data, and more. There are a lot of add-ons to be had in Cydia as well. If you've ever used SBSettings in the past, you'll even be home with NCSettings. The only difference is that NCSettings just integrates with the existing Notification Center interface, which means fewer gestures to remember and more information and functionality all in one place. RetinaPad There are a lot of apps out there that are just for iPhone. While Apple will allow you to download them from your iPad, they are small and when you extend them to 2x to fill the screen, they are grainy and look like. This is where RetinaPad comes in handy. Once you've installed RetinaPad, you'll automatically detect any traditional iPhone app you open on your iPad and automatically overtake it so it doesn't look like. While it doesn't completely fill all the screen as a native iPad app would, it makes it look a much better heck and much more bearable. If you only have iPhone apps that you really want to run on your iPad, RetinaPad is a must. \$2.99 - Cydia Search Link MountainCenter If you have a Mac running OS X Mountain Lion, you're probably familiar with how the Notification Center works on it. While this method is not really viable on a screen as small as the iPhone, it is on the iPad or iPad mini. I've never been a fan of how the Notification Center pulls down on the iPad. It's almost as if they took the default iPhone Notification Center layout and locked it on the iPad. It's not customized for iPad and it just feels like a cheap port. MountainCenter gives you the same kind of experience on your iPad or iPad mini that you have on your Mac with Notification Center. Simply pop into Settings and set up a gesture to trigger MountainCenter and you're ready to go. Swipe right or left to reveal the Notification Center on the side as you can in Mountain Lion. It only feels better than the default implementation of the notification center for iPad. Not to mention that you'll be able to see more data at a glance than the default value offers. \$2.99 - Cydia Search Link Emblem Just like the Notification Center feels half ripe, so is the default banner notification mode displayed on the iPad and iPad mini. While they cover Length of the top of the screen for the iPhone, its not on the iPad and again, it feels like a super cheap port. It works on the iPhone, but not correctly so well on the iPad or iPad mini. Although you can always expect Apple to make improvements to banner notifications on your iPad, iPad, Download the emblem that solves the problem right now. Instead of seeing stock banners that don't look so big on your iPad to start with, Emblem turns notification alerts on the iPad into OS X and grows like banners that will look on the top right of the screen. Touching on one will launch the notification program has been received from. If you receive more than 3 notifications, Emblem will combine them into stacks through which you can scroll instead of taking half the screen with banners. If you don't take any action on a banner, it will simply roll away just like stock notification banners would be. \$1.99 - Cydia Search Link SwipeSelection While the iPad can be an excellent business tool, the keyboard still needs some work. Typing on it, especially when you make errors, can be daunting and slow at times unless you're using a keyboard accessory. Even that can still be annoying when you get to the screen to correct errors or add content. SwipeSelection aims to solve these problems by adding additional features to the virtual keyboard. For example, instead of using your finger to move the cursor with the magnifying glass, SwipeSelection simply allows you to drag your finger back and forth or up and down on the actual keyboard to move the cursor position. It doesn't seem like a big deal, but when correcting and editing text, it loads faster than moving your finger all the way to the top of the screen again. Another very nice action happens when you hold down the change and pull your finger. You'll notice that this highlights the selection of text you're dragging over. It's much more natural than double tapping the screen or tapping and then dragging a cursor around. Your fingers are already on the keyboard, why don't you keep them there? Your choices? While these are our favorite apps that we think will improve the iPad experience, everyone uses their iPad for different reasons. We're sure all of you have come across some pretty awesome tricks that rank in the top 5. Share them below in the comments! Reviews!
